RESEARCH MEMORANDUM

TABULATED PRESSURE COEFFICIENTS AND AERODYNAMIC CHARACTERISTICS MEASURED IN FLIGHT ON THE WING OF THE D-558-I RESEARCH AIRPLANE THROUGH A MACH NUMBER RANGE OF 0.80 TO 0.89 AND THROUGHOUT THE NORMAL-FORCE-COEFFICIENT RANGE AT MACH NUMBERS OF 0.61, 0.70, 0.855, AND 0.88

By Earl R. Keener and Rozalia M. Bandish

SUMMARY

Tabulated pressure coefficients and aerodynamic characteristics obtained in flight from pressure distributions over six chordwise rows of orifices on the right wing of the D-558-I research airplane (BuAero No. 37972) are presented. The data were obtained through a Mach number range of 0.80 to 0.89 and throughout the normal-force-coefficient range at Mach numbers of 0.61, 0.70, 0.855, and 0.88. This paper supplements similar tabulated data which have been presented in NACA RM L50J10 and NACA RM L50L12a.

INTRODUCTION

As part of the National Advisory Committee for Aeronautics' high-speed flight-research program, pressure-distribution measurements have been made over six chordwise rows of orifices on the right wing of the Douglas D-558-I research airplane (BuAero No. 37972) to determine the chordwise and spanwise loading at subsonic and transonic Mach numbers.

References 1 and 2 have presented tabulated pressure coefficients and aerodynamic characteristics obtained from some maneuvers in the subsonic and transonic regions. The present paper supplements references 1 and 2 and includes data obtained throughout a Mach number range of 0.80 to 0.89 and throughout the normal-force-coefficient range at

Mach numbers of 0.61, 0.70, 0.855, and 0.88. In order that the data may be made available at an early date, no analysis is included.

SYMBOLS

$b/2$ wing semispan (12.5 ft)

$b'/2$ spanwise distance from row 1 to wing tip (10.1 ft)

c local wing chord parallel to plane of symmetry, feet

$\bar{c}$ average chord of wing panel, feet (S'/b')

c' mean aerodynamic chord of the wing panel (5.80 ft) $\left(\frac{2}{S'}\int_0^{b'/2} c^2 dy'\right)$

c_n section normal-force coefficient $\left(\int_0^1 P_R \, d\frac{x}{c}\right)$

$c_{m_{c/4}}$ section pitching-moment coefficient about 0.25-local-chord point $\left(\int_0^1 P_R\left(0.25 - \frac{x}{c}\right) d\frac{x}{c}\right)$

c_m section pitching-moment coefficient about a line perpendicular to longitudinal axis of airplane, passing through the 0.25c' $\left(\int_0^1 P_R\left(\frac{0.50c - 0.25c'}{c} - \frac{x}{c}\right) d\frac{x}{c}\right)$

x_{cp} wing panel chordwise center of pressure, percent c'

y'_{cp} wing panel lateral center of pressure, percent $b'/2$

C_{N_A} airplane normal-force coefficient $\left(\frac{Wn}{qS}\right)$

$C_{N'}$ wing panel normal-force coefficient $\left(\int_0^1 c_n \frac{c}{\bar{c}} d\frac{2y'}{b'}\right)$

$C_{B'}$ wing panel bending-moment coefficient about row 1 $\left(\int_0^1 c_n \frac{c}{\bar{c}} \frac{2y'}{b'} d\frac{2y'}{b'}\right)$

$C_{M'}$ wing panel pitching-moment coefficient about the 0.25c' $\left(\frac{\bar{c}}{c'} \int_0^1 c_m \left(\frac{c}{\bar{c}}\right)^2 d\frac{2y'}{b'}\right)$

g acceleration due to gravity, 32.2 feet per second^2

M free-stream Mach number

n normal load factor

p local static pressure, pounds per square foot

p_l local static pressure on lower wing surface, pounds per square foot

p_o free-stream static pressure, pounds per square foot

p_u local static pressure on upper wing surface, pounds per square foot

P pressure coefficient $\left(\frac{p - p_o}{q}\right)$

P_R resultant pressure coefficient $\left(\frac{p_l - p_u}{q}\right)$

q free-stream dynamic pressure, pounds per square foot

S total wing area, including area projected through fuselage (150 sq ft)

$S'/2$ area of a single wing panel outboard of row 1 (57.5 sq ft)

W airplane weight, pounds

x chordwise distance rearward of leading edge, feet

y spanwise distance outboard of airplane center line, feet

y' spanwise distance outboard of row 1, feet

δa_R deflection of right aileron, degrees

DESCRIPTION OF AIRPLANE AND TEST PANEL

The Douglas D-558-I research airplane used in these tests is shown in figure 1. A three-view drawing of the airplane showing the general over-all dimensions is shown in figure 2. Other pertinent dimensions are given in the symbols.

The airplane has an untwisted, 10-percent-thick wing with a taper ratio of 0.54, an aspect ratio of 4.17, and an incidence angle of 2°. The 50-percent-chord line is perpendicular to the longitudinal axis of the airplane. An NACA 65-110 airfoil section is employed at all wing stations. Table I gives the ordinates of the airfoil section. A smooth finish over the wing was maintained throughout the tests.

The test panel for which pressure-distribution data are presented is the part of the right wing of the airplane outboard of wing section 28.75 inches.

INSTRUMENTATION

Standard NACA instruments were used to record airspeed, altitude, normal acceleration, aileron position, rolling angular velocity, and yaw angle. The airspeed head was mounted on a boom, the static vents of which were located 1 chord ahead of the right wing tip. Wing resultant and individual pressures were measured by two NACA 60-cell recording manometers. All instruments were synchronized by a common timer.

Flush-type orifices installed in the right wing skin were connected to the instrument compartment by $\frac{1}{8}$-inch inside-diameter aluminum tubing. Three-sixteenth-inch inside-diameter rubber tubing was used between the aluminum tubing and the manometer cells. The average length of aluminum tubing varied from approximately 8 feet at the root station to approximately 18 feet at the tip station. Approximately 4 feet of rubber tubing were used on each line.

The orifices were arranged in six chordwise rows, the chordwise and spanwise locations of which are shown in table II. Row 1 was located at wing station 28.75, the inboard boundary of the wing panel. Wherever possible, the orifices on the lower surface were located directly below the corresponding orifices on the upper surface; however, structural difficulties made this impossible in several cases. Errors due to location of orifices were considered to be negligible.

ACCURACY

The accuracy of the results is estimated to be within the following limits:

Mach number	±0.01
P and P_R	±0.02
c_n	±0.03
$c_{m_{c/4}}$	±0.006

TESTS

The data presented herein were obtained from two speed runs through a Mach number range of 0.80 to 0.89, from gradual pull-ups at Mach numbers of 0.88 and 0.855, and from wind-up turns at Mach numbers of 0.70 and 0.61. The speed runs, the pull-ups, and the wind-up turns were started at altitudes around 35,000 feet. To perform the wind-up turn, the airplane was entered into a gradual right turn which was tightened until the airplane stalled. During the turn the Mach number was held approximately constant and the ailerons were held near neutral.

METHODS

The section of the right wing outboard of row 1, table II(b), is treated as an isolated panel, and the coefficients obtained from integration of the pressure distributions are based upon its geometric properties. The wing-fuselage fairing includes the leading edge of row 1; however, the section load computations are based upon the chord of row 1 excluding the fairing.

The pressure differential between the lower and upper wing surfaces was measured at rows 1, 2, 3, 4, and 6. The upper and lower surface pressures were measured separately at row 5 relative to the instrument compartment pressure. The instrument compartment pressure was measured relative to the boom static pressure, which was corrected to free-stream static pressure by use of the radar tracking method of reference 3. Ground checks showed that lag in the pressure system was negligible for the rates of change of pressure encountered in these tests.

Distributions were selected at intervals in Mach number of approximately 0.01 during the speed run and at intervals in normal-force

coefficient of approximately 0.1 during the pull-ups and wind-up turns. All test points were selected at low aileron deflections (less than $\pm 1^{\circ}$) and at low rolling velocities (less than 0.2 radian per sec).

Section aerodynamic characteristics were obtained by mechanical integration of the chordwise pressure distributions. Panel aerodynamic characteristics were obtained by mechanical integration of spanwise distributions of loads and moments.

PRESENTATION OF DATA

The measured pressure coefficients and the calculated section and wing-panel characteristics are presented through a Mach number range of 0.80 to 0.89 in table III and throughout the normal-force-coefficient range at Mach numbers of 0.61, 0.70, 0.855, and 0.88 in tables IV, V, VI, and VII, respectively. Pressure coefficients are not presented for all the orifices, because some of the cells were inoperative and some of the orifices were not connected.
